

Intro to Single Page Web Applications

Springfield Web Meetup Group - May 2015

Dan Quinn

- twitter/github: @danielpquinn
- smashingideas.com
- earlybirdy.com

Agenda

- Architectural overview
- Brief history of single page apps
- Why build single page apps? Why not?
- My experience with single page apps
- Check out some sample code
- QA / Open discussion

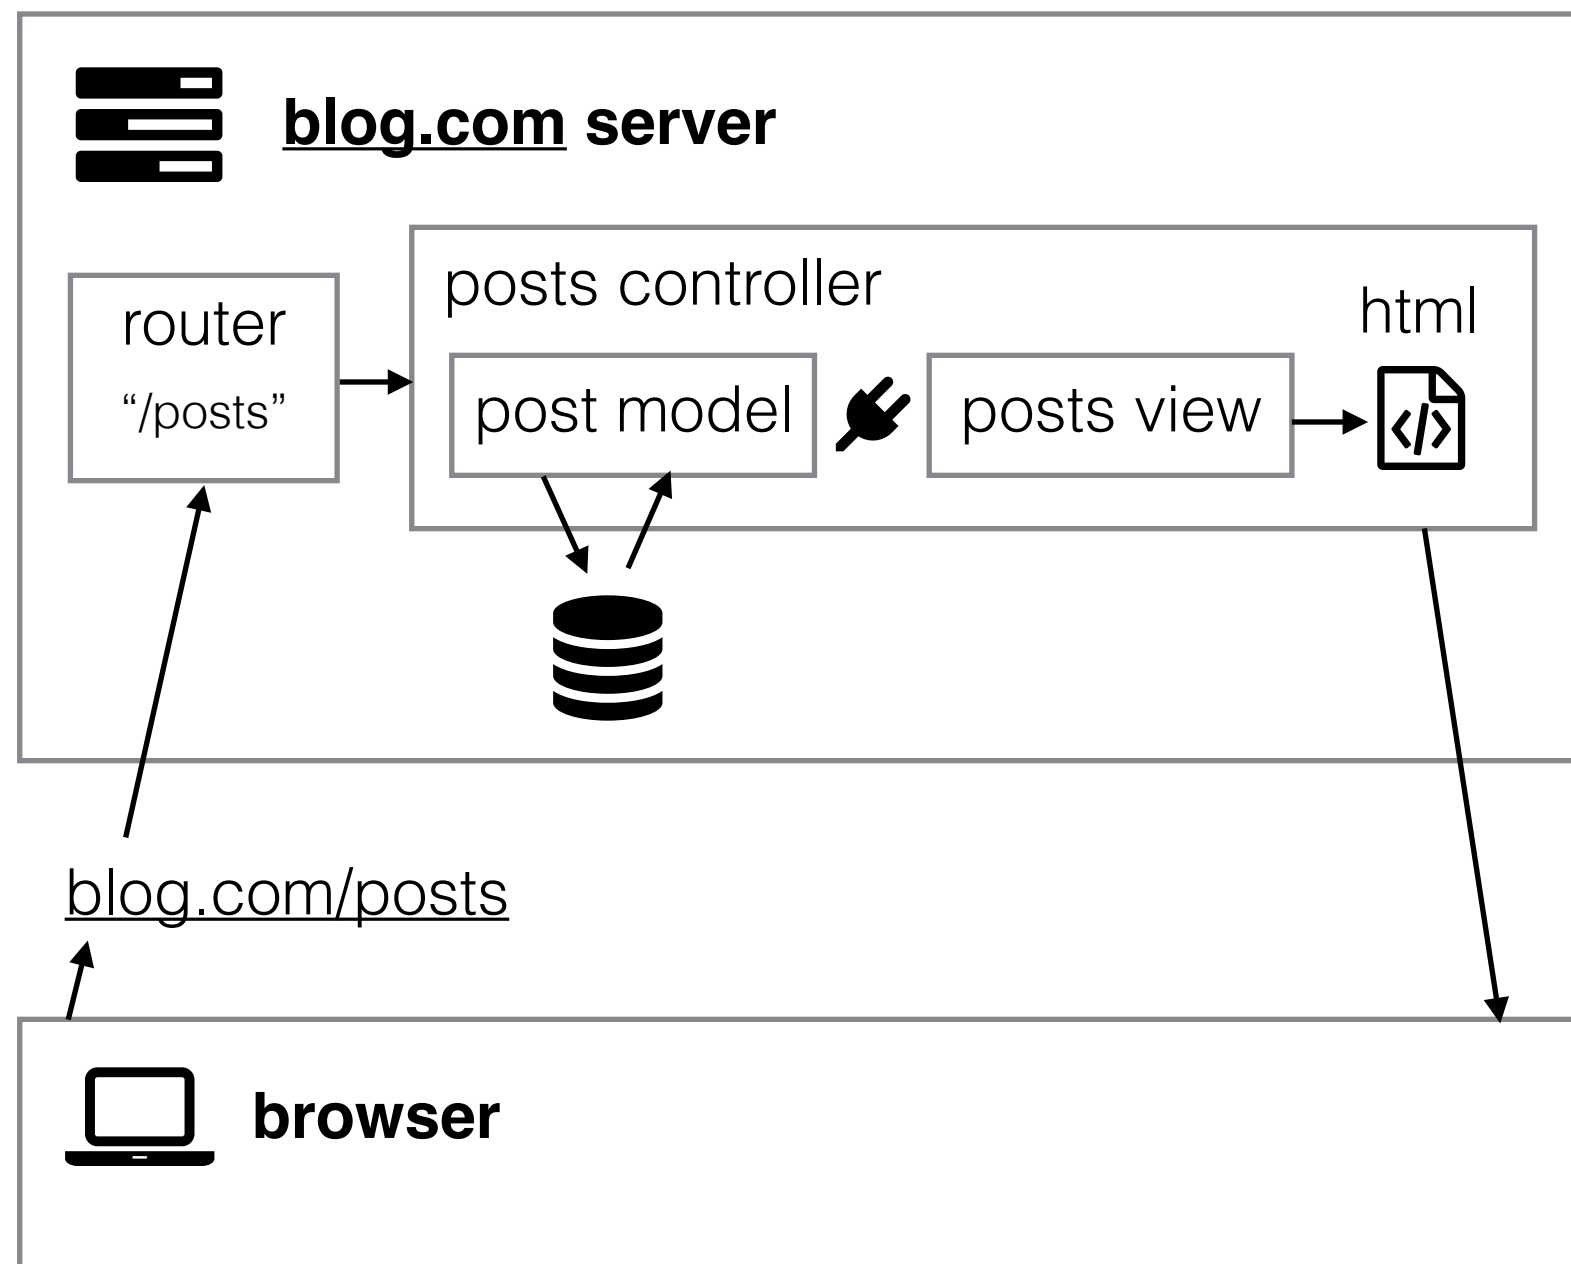

What is a SPA?

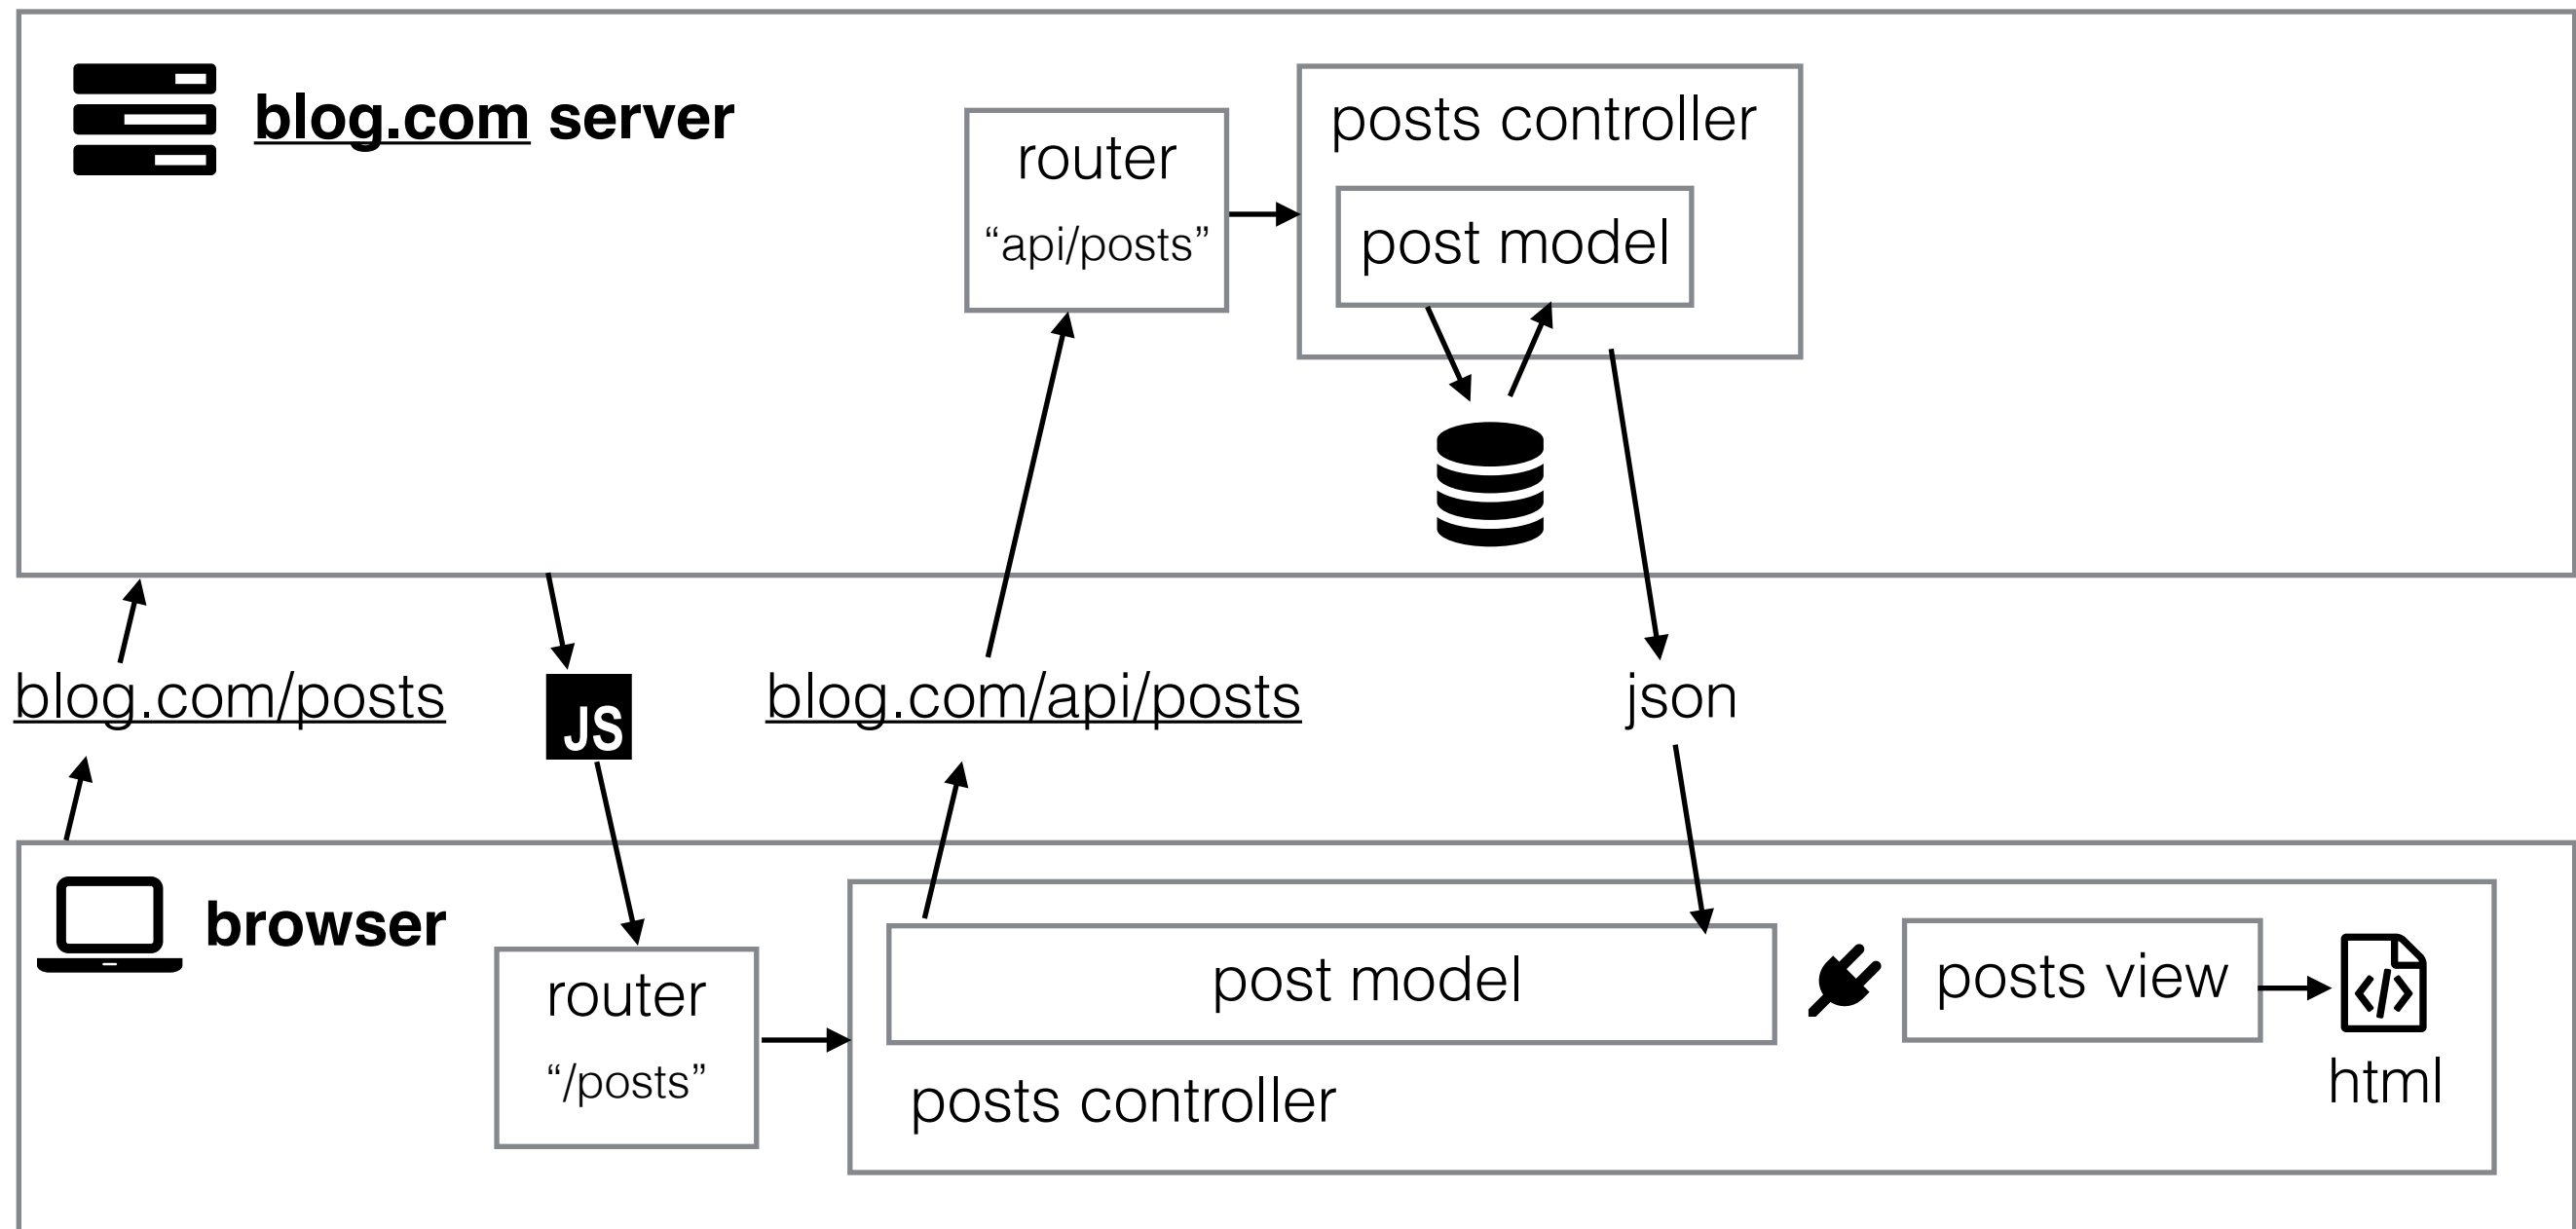

single page web application

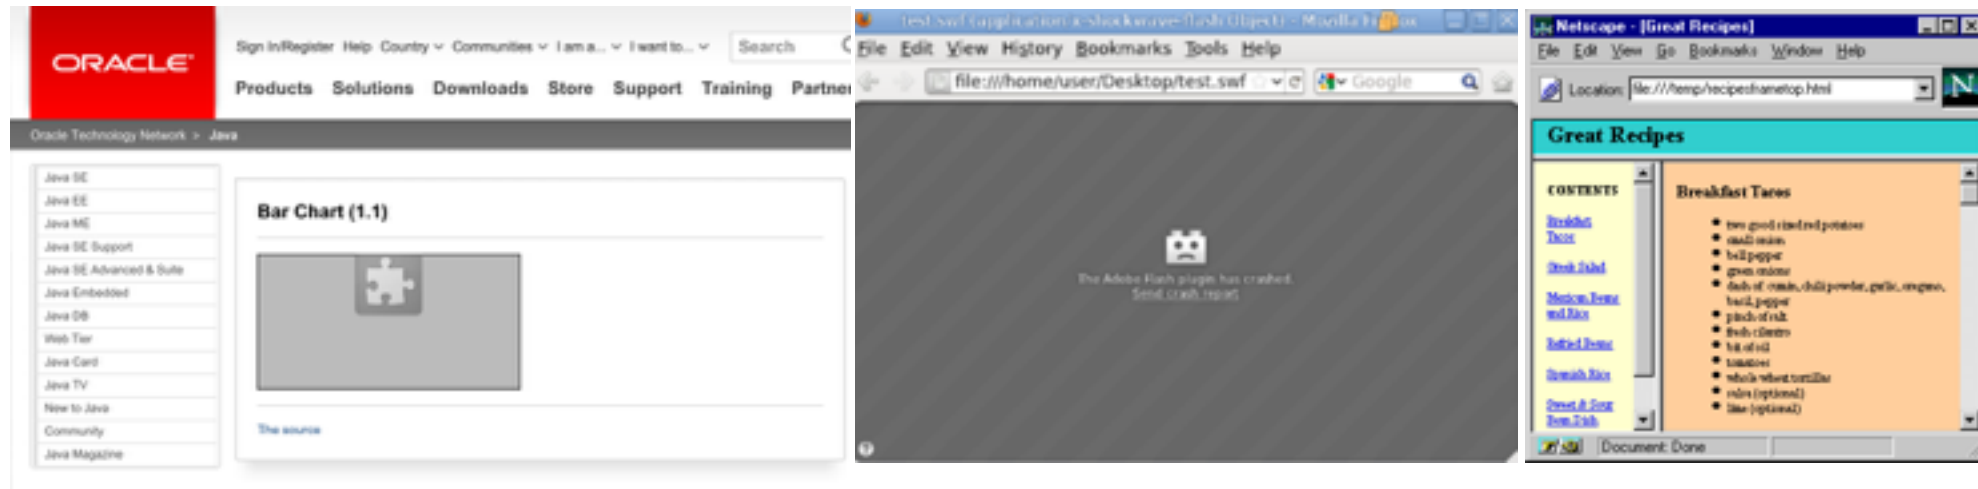

Traditional Web Application Architecture

Interest over time ? ☒ News headlines ☐ Forecast ?

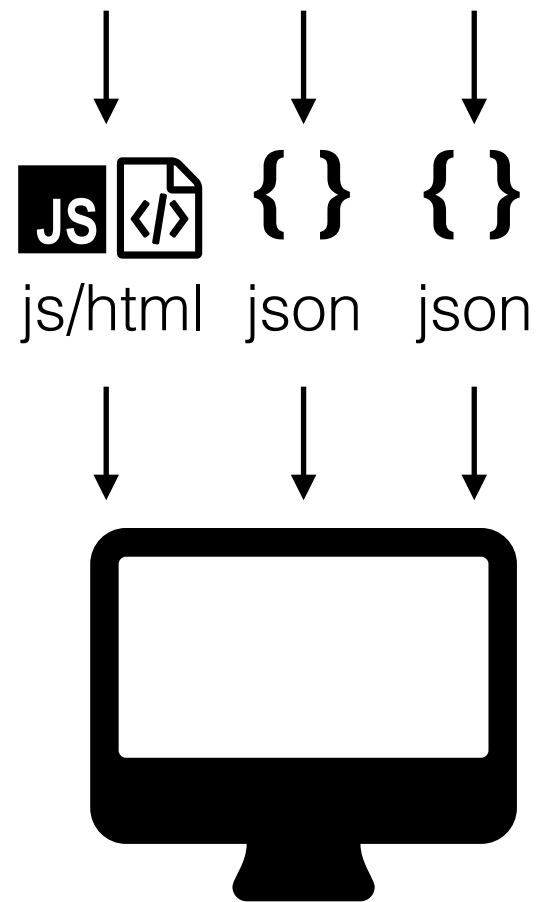

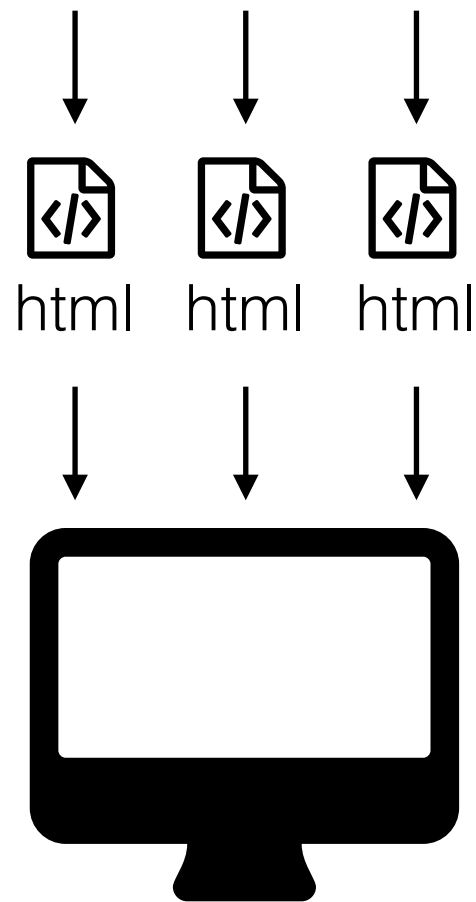

Why?

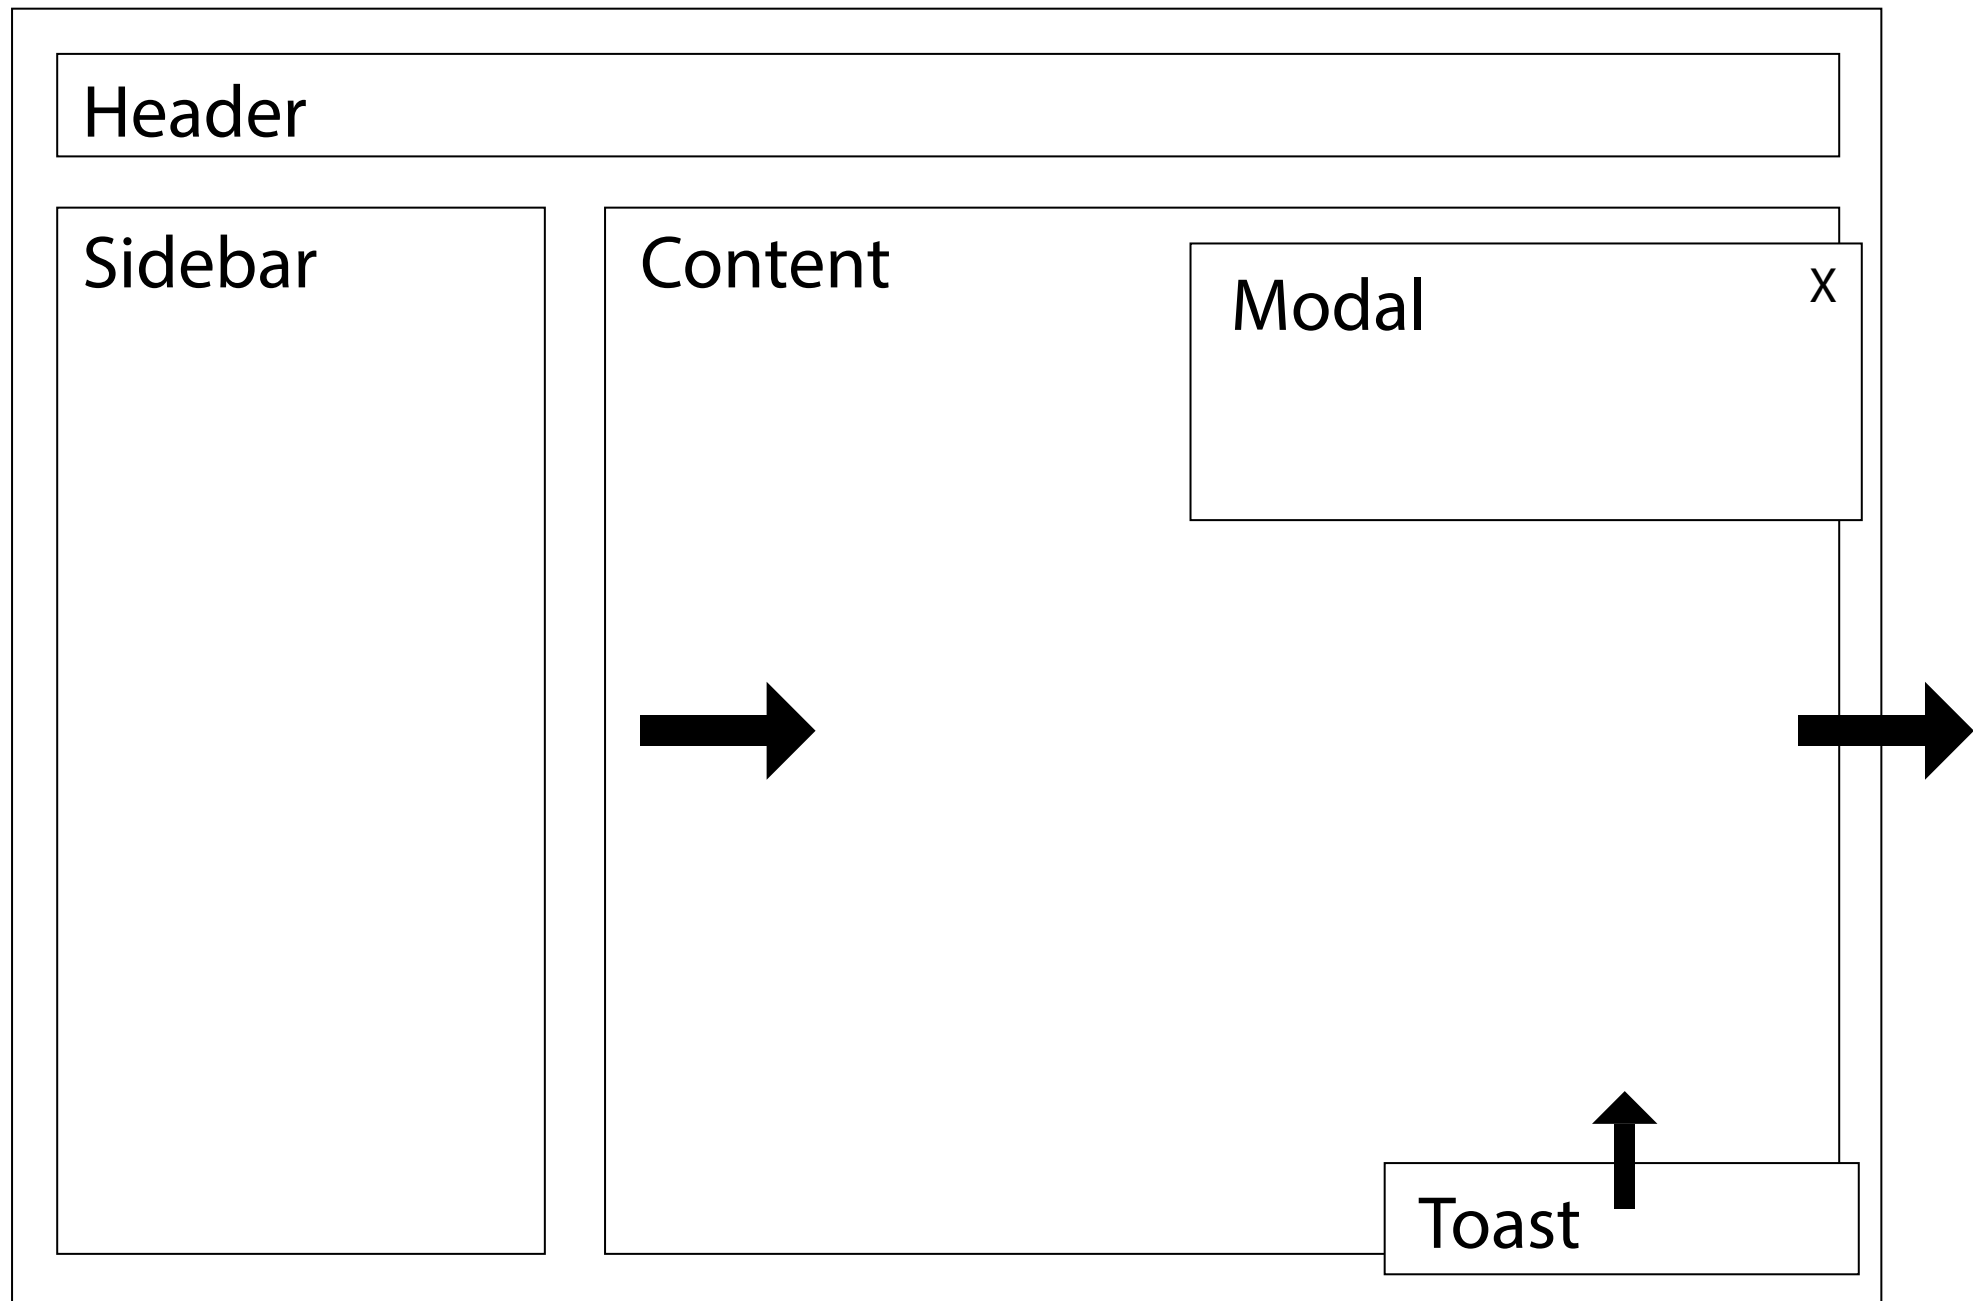

Separation of Concerns

Less data (maybe)

User Experience

Let's look at code

<http://github.com/danielpquinn/springfield-web-spa>

main.js

- Entry point into application
- Create a new instance of App after DOMContentLoaded
- Create Post model
- Create header, sidebar and content View instances
- Create a router, define routes
- Execute current route (home)

router.js

- Stores internal list of route definitions
- **addRoute** takes route, controller function
- **navigate** takes path, matches route, pulls out params and executes controller function using those params. Finally updates url using history API's pushState

model.js

- Subclassed and assigned static config properties
- **list** returns a list of items (/api/posts)
- **fetch** returns a single item (/api/posts/:id)
- **save** saves current state (put /api/posts/:id)
- **create** creates a new item (post /api/posts)
- **remove** removes item (delete /api/posts/:id)

view.js

- Subclassed, instantiated with template container id
template function
- **render** takes data as argument and plugs it into
string template, inserts result into DOM

Thanks!
